1st Section:

Should be their name

2nd Section:

- What is the field of implementing and perfecting data encryption to protect sensitive information?
  Cryptography
- Which cryptography example is designed to use only one key to encrypt and decrypt a message?
  Symmetric
- How does mathematics show up in cryptography?
  Mathematics shows up in cryptography in a variety of ways. The ciphers themselves use number theory concepts. The ciphers also use concepts from linear algebra. (Note: answers may vary here. If they mention a branch of mathematics, the answer is correct.)
- What are four core principles of cryptography and give a short definition for one of them?
  Confidentiality – ensures information is only accessible to authorized users
  Integrity – ensures that information is accurate and unaltered throughout its cycle
  Authentication – verifies the identity of a user or system is valid
  Non-repudiation – prevents a party from denying their previous actions
  (Note: I only ask they define one of the principles)

3rd Section:

Encryption Time!

UOQGNMGKUYPRKZMVXJ

4th Section:

Decryption Time!

MAKE SURE TO LOCK YOUR COMPUTER

5th Section:

Congratulations! Done.
